Porcelain and Ceramic Tiles
2020: a new revolution of spaces and ways of living in them begins.

A transformation that makes it easy from the design stage, to include new sanitation measures to be able to create living and working spaces in total freedom and safety.

The R&D laboratories of RAK Ceramics are always at the forefront of technology and were the first in the world to provide antibacterial solutions for interior design in 2009, thanks to the development of special certified antibacterial glazes.

Today, with the new RAK-Sanit program, RAK Ceramics offers an even wider range of solutions for floors, walls and sanitaryware, made with glazes that inhibit the growth of bacteria, thus reducing the possibility of contagion and contributing to create a healthier environment.

RAK-Sanit is the ideal solution for modern and safer schools, public and private offices, restaurants, hotels, laboratories and for all the spaces where hygiene is of primary importance.

STAY SAFE WITH RAK-SANIT
The methodology of application of this product integrated into the glaze during the production process, gives the pieces permanent protection.

The antibacterial glazes are only detrimental to the bacteria. Not for any other living being.

Reduction of bacterial degradation on the surface of ceramic tiles to reduce odours.

The action of the antibacteria is a perfect complement to the daily cleaning of the tile. Ideal for use in hospitals, nursery schools, supermarkets, etc.

Continuous antibacterial protection for 24 hours; the technology of these products do not require the presence of light to activate its biocide properties.

The colors and finishes, matte, gloss, rustic, transparent, opaque, can be selected to suit the aesthetic needs of the pieces. The antibacterial glaze does not limit the development of the colours, finishes and textures of the pieces and can be selected to suit the aesthetic needs.

Prevention of the degradation of the surface of the tile produced by bacteria.

Suitable for all areas where high performance of hygiene, cleanliness, safety and ease of maintenance is required: kindergartens, schools, swimming pools and sports facilities, changing rooms, private and commercial kitchens, restaurants, carneys, medical and food industries, etc.
RAK-Sanit is a complete solution that includes Gres Porcelain and Ceramic tile collections that reduce bacterial contamination and contribute to a healthier living and working environment owing to its antibacterial properties given by silver nitrate compounds.

RAK-Sanit antibacterial collection of wall and floor tiles feature antibacterial technology which is integrated into the tile surface permanently. Once bacteria comes into contact with the tiled surface, the silver ions initiate the elimination cycle. Silver ions in the antibacterial tile surface bind to enzymes, proteins, cell membranes and the DNA of the microbe to damage DNA and block reproduction. This results in the death of the organism.

This specialised glaze is incorporated into the glaze on the tile during the manufacturing process. The firing of the glaze into the tile at high temperatures creates a surface that inhabits the growth of microbes that come in contact with the tile.

**Effective in 8 hours**

Certified effectiveness

RAK-Sanit tiles are tested by CERFRIT Laboratory – USA, according to the Japanese Standard JIS Z 2801:2000. This Standard specifies the testing methods to evaluate antibacterial activity and efficacy on bacteria on the surface of the products.

RAK-Sanit tiles are tested by METS Laboratory – UAE, according to the International Standard ISO 27447:2019. This Standard specifies the test method for antibacterial activity of semiconducting photocatalytic materials. Test method for the determination of the antibacterial activity of materials that contain a photocatalyst or have photocatalytic films on the surface, by measuring the enumeration of bacteria under irradiation of ultraviolet light.

Bactericide action is very fast and effective with a very strong decrease of bacteria colonies.

More than 99.9% of bacteria are killed. Antibacterial action tested both in dark and light.
APPLICATIONS

- Hotels, Conference Centres, Restaurants and Canteens
- Laboratories and Medical Offices
- Wellness Centres, Gyms, Pools, Leisure Centres
- Schools, Kindergarten, Playgrounds
- Public and Private Offices
- Public Bathrooms
- Residential
HOTELS, CONFERENCE CENTRES, RESTAURANTS AND CANTEENS

LABORATORIES AND MEDICAL OFFICES
WELLNESS CENTRES, GYMS, POOLS, LEISURE CENTRES

SPECIFYING ANTIBACTERIAL TILES

Specifying the correct floor and surfaces for spaces where hygiene is of primary importance is a complex and important decision making process.

RAK Ceramics is well experienced in this area and its products have been installed in many schools, offices and hotels all over the world.

RAK-Sanit product range has been specifically manufactured to meet the requirements of the highest Health Standards. RAK Ceramics also offers a bespoke service for projects with specific requirements.

PROJECT SPECIFICATION FOR RAK-SANIT SOLUTIONS

Antibacterial Gres Porcelain / Ceramic tiles that reduce bacterial contamination up to 99.9% owing to its antibacterial properties given by silver nitrate compounds (Standard ISO 27447:2019 or JIS Z 2801:2000).

Standard antibacterial testing for ISO 22447.

Mandatory Antibacterial activity:
- Active 24h
- Tested both in the dark and in the light
- Effective on the surface
- Permanent, integrated into the product during the firing cycle at temperatures above 1200 degrees centigrade
- Durable over time for the entire life of the ceramic product.

ANTIBACTERIAL GROUTS

We recommend specifying the use of antibacterial grouts for joints, available in the market, to ensure safe protection over the entire surface.

For installation, cleaning and maintenance, we recommend following the normal procedures and indications contained in the catalogs and technical manuals of gres porcelain / ceramic tiles. Avoid abrasive products and detergents containing waxes or filming products, do not apply resins, waxes or protective agents.

TECHNICAL FEATURES

PORCELAIN TILES (BIa-GL):

Porcelain tiles are manufactured using pure, selectively imported raw materials mixed using the most advanced extraction and sorting techniques; they are obtained with a production process similar to that of single-fired tiles.

The resulting product is top-quality porcelain tile, obtained by raw materials wet grinding, followed by partial drying by spraying, silo storage to allow homogenization of properties, and pressing with highly efficient hydraulic presses up to specific pressures more than 500 kg/cm². The high pressure combined with high firing temperature exceeding 1200 °C results in highly compact & strong ceramic surface with very low water absorption (lower than 0.5% according to UNI EN ISO 10545-3) and extremely high mechanical resistance (average value exceeding 50 N/mm² according to UNI EN ISO 10545-4).

Thanks to their low porosity, these porcelain tiles are frost-proof and rated as belonging to the B1a-GL class according to the European Standard UNI EN 14411 which requires water absorption ≤ 0.5%.

The MoR (modulus of rupture) in accordance with UNI EN ISO 10545-4 results to 50 N/mm² while the required value is 35 N/mm². RAK Ceramics porcelain tiles are available in a wide range of designs, sizes and finishes.

ADVICE ON LAYING

Although our porcelain tiles can be installed using traditional cement mortars, we advise using modern adhesives. While installing on wall, the two-layer spreading system is recommended to perfectly wet the back of the tile.

Quickly dipping each tile in water before installation will remove any dust on the back of the tile for perfect adhesion. Do not wet the tiles if you are using styro, acrylic resin adhesives or two-component organic-solvent based adhesive.

It is advisable to incorporate suitable shrinkage - flexion joints (movement / expansion joints) when installing on large floors: these joints should never be spaced more than 6 – 8 linear meters apart indoors and 3 linear meters apart outdoors. Be careful while using strong coloured grouts as they might leave stains on the surface of the tiles that may be difficult to remove later.

NOTE: Shade variation across the batches is inherent to the manufacturing process and the pre-laying colour comparison is recommended.

**NOTE:** Shade variation across the batches is inherent to the manufacturing process and the pre-laying colour comparison is recommended.
Red body ceramic tiles are made with finest quality clays and with chamotte (a ceramic raw material with high percentage of silica). These raw materials are submitted to dry grinding and suitably mixed and wet and then pressed with hydraulic presses. Quick cycle supporting firing is obtained via roller kilns reaching temperatures of approximately 1100°C. After biscuit glazing, the vitrified product is sintered in a single-layer roller kiln at approximately 1030°C. The resulting wall tiles have an average bending strength that is higher than 15 N/mm² in accordance with the UNI EN 14411 standard. This class of products shows virtually no shrinkage during firing; therefore a dimensional consistency results in extremely easy laying.

ADVICE ON LAYING
Ceramic red body tiles can be laid using either tile adhesives or cement mortar. Under no circumstances should the tiles be wet before laying when using acrylic or vinyl resin based adhesives or two-component organic solvent based adhesives. When laying large sized tiles it is best to adopt the two-layer spreading method and, when the laying surface is very large, to provide for suitable expansion joints which must not be spaced more than 4 to 5 linear meters apart from one another.

IMPORTANT POINTS TO REMEMBER WHILE LAYING THESE TILES
When laying on wet concrete or plaster, leave to dry for at least one week for each centimetre of thickness. When laying on brick, never lay on tile adhesive measuring more than 4 to 5 mm in thickness. For laying on flexible supports (for example plasterboard panels, polymer panels, etc.) which may result in movement of the tiles, we advise laying on tile adhesive measuring no more than 3.5 mm in thickness and to use class C2 or D1 glues. For laying on waterproof brick, which prevents the release of damp, we advise laying on tile adhesive measuring no more than 3 mm in thickness and to use class C2 or D1 glues. Avoid laying without expansion joints or joints where stress due to expansion is released directly onto the tile.

Note: Shade variation across the batches is inherent to the manufacturing process and the pre-laying colour comparison is recommended.
**DOMESTIC PURPOSE**

**SUGGESTED APPLICATIONS**

- Residential areas, hotel rooms, bathrooms

**COLOUR VARIATIONS**

- V2: LIGHT
- V1: EVEN

**INDICATIONS FOR USE**

- The least amount of shade variation attainable.
- Light to moderate shade variation within each carton.

**SURFACE STRUCTURE**

- S: SMOOTH: Tiles with an even and regular surface, free from perceptible projections, lumps, or depressions.
- LS: LIGHT STRUCTURE: Tiles with an uneven, irregular surface, with a structure perceptible to the eye and touch.

**SURFACE LOOK**

- G: GLOSSY: The resulting surface has a medium degree of reflection.

**FINISH**

- N: NATURAL: Pressed tiles without further work after firing.

**TYPOL OGY**

- PT: PORCELAIN TILES
- CB: C/B: COMBINED BODY TILES

**EDGE**

- R: RECTIFIED
- STRAIGHT

**TYPOLOGY**
